SUMMARY

Senior-level Full-Stack & Backend Software Engineer with over 7 years of experience designing, architecting, and scaling high-throughput distributed systems, event-driven microservices, and modern web applications using C#, .NET 8+, TypeScript, and Angular/React. Proven track record of optimizing ingestion pipelines, engineering clinical and financial automation engines, leading cloud infrastructure practices across AWS and Azure, and leveraging modern AI-assisted engineering workflows (Claude Code) to accelerate technical spec writing, system design, bug diagnosis, and code delivery.

TECHNICAL SKILLS

Languages: C#, TypeScript, JavaScript, SQL, Python

Backend & Architecture: .NET 8+, Microservices, Event-Driven Architecture, RESTful APIs, Entity Framework Core, Temporal, Node.js, Express, Async Pipelines

Frontend: React, Angular, Vue.js, HTML5/CSS3, TypeScript

Cloud & DevOps: AWS (EKS, Lambda, S3, AppConfig, ECR), Azure (App Services, Functions, DevOps), Docker, Kubernetes/KEDA, OpenTofu/Terraform, CI/CD (GitHub Actions, Azure DevOps), SOLID Principles

AI-Assisted Engineering: Claude Code (Technical Spec Drafting, System Design Collaboration, Bug Diagnosis, Code Generation, Test Suites)

Databases & Messaging: SQL Server, MySQL, DynamoDB, Firestore, Asynchronous Queues

PROFESSIONAL EXPERIENCE

Software Engineer (Senior Level Scope) | Rhyme (Columbus, OH - Remote) July 2025 – Present

- Architected and engineered an end-to-end conversational prior-authorization intake flow across 15 microservices and 3 repositories, leveraging React, .NET Core, an AI response-schema transformer, and Temporal workflows backed by a comprehensive mock-payer test suite.
- Utilized Claude Code as a daily AI pair-programmer to collaborate on technical designs, draft OpenAPI specs, diagnose complex microservice production defects, and rapidly generate high-coverage test suites (NUnit/Jest), significantly accelerating sprint delivery.
- Optimized cloud infrastructure by replacing fixed-replica Temporal workers with KEDA event-driven autoscaling on Amazon EKS, securing Temporal Cloud authentication via TriggerAuthentication and Helm chart templating to scale dynamically on queue depth without application changes.
- Resolved high-severity production defects across critical live paths, restoring failed PROD writebacks for 50 provider organizations (~23 cases/day), building an event-replay recovery script to reprocess ~1,400 stalled Aetna cases, and fixing sequential name-matching logic to resolve ~880 monthly failures on hyphenated surnames.
- Spearheaded LA Care's PAS pilot acceptance by building Rhyme's Da Vinci FHIR payer-integration surface—incorporating pended Claim Response handling, Inquiry reference mapping, and cross-payer authorization normalization—subsequently adopted by Humana, BCBSM, and Elevance.
- Architected the Provider Intake v4 inbound messaging pipeline on a new Temporal project and task queue for high-volume X12 5010 transactions (270/271/276/277/278), configuring EKS workloads, Helm charts, and AWS AppConfig for seamless side-by-side traffic cutover.
- Drove platform-wide modernization and infrastructure initiatives, integrating AWS AppConfig for PSA UM integrations, consolidating shared client libraries, executing .NET runtime upgrades, and embedding OpenTofu/Terraform and Helm changes natively within core feature workflows.

Software Engineer | StarTex Software (Houston, TX - Remote) **March 2024 – July 2025**

- Built scalable .NET Core APIs and backend services powering an enterprise safety compliance platform serving 500,000+ active users.
- Redesigned data-access layers by introducing bulk save/update patterns and batch processing, cutting database round-trips and processing times by 25%.
- Standardized team API integration by authoring comprehensive Postman collections, OpenAPI specifications, and developer onboarding workflows, decreasing partner integration ramp-up time by 40%.
- Collaborated on multi-platform feature parity, maintaining strict contract consistency across web and mobile endpoints.

Advanced Software Engineer | Relativity (Chicago, IL - Remote) **April 2022 – March 2024**

- Engineered distributed ingestion pipelines and document classification APIs using .NET Core microservices for an enterprise eDiscovery platform, processing over 1,000,000 documents/day with 95% accuracy.
- Improved overall pipeline throughput by 35% through microservice decoupling, query optimization, and classifier parallelization.
- Led sprint planning, technical design reviews, and code quality initiatives across Agile teams; mentored mid-level and junior engineers in SOLID principles and system design.

Software Engineer | Kunz, Leigh & Associates (Okemos, MI) **April 2020 – April 2022**

- Delivered full-stack enterprise solutions for mission-critical public sector applications utilizing Angular and .NET Core.
- Authored optimized SQL scripts, stored procedures, and Entity Framework queries to maintain zero-downtime operations on high-concurrency public databases.
- Mentored junior engineers and interns, establishing unit testing standards (NUnit, Jest) and code review checklists across the engineering team.

Software Engineer Intern | Kunz, Leigh & Associates (Okemos, MI) **August 2019 – April 2020**

- Modernized legacy Visual Basic applications to .NET Core and authored SQL migration scripts.

Programmer Intern | Ipsos in North America (Bloomfield Hills, MI) **June 2019 – August 2019**

- Upgraded legacy academic tools to modern .NET frameworks and assisted in dynamic survey development.

EDUCATION

Bachelor of Science in Computer Science | Oakland University Rochester, MI
